

Student Grading System

Imported Modules and Requirements

Imported Modules

All imported modules are part of Python's standard library, so nothing extra has to be installed.

Module	Why it is used
json	Saves student data to students.json and loads it back on the next run.
os	Checks whether the data file exists before trying to load it.
__future__ (print_function, division)	Makes printing and division behave the same on Python 2 and Python 3.

Requirements

- Python 3.6 or newer (also works on Python 2.7)
- No external packages to install, so no pip install is needed
- A terminal or command prompt to run the program
- Permission to create a file in the project folder (for students.json)

Run Command

```
python grading.py
```

On some systems you may need to use `python3 grading.py` instead.
